                                                                                                                                                                                                                                              , of
                                                                                        spliced
ends:
including collagen, fibrin, heparin, DNA, and actin. Fibronectins are involved in cell adhesion, cell motility, opsonization, wound healing, and maintenance of cell shape.

SUBUNIT: Mostly heterodimers or multimers of alternatively spliced variants, connected by 2 disulfide bonds near the carboxyl ends; to a lesser extend homodimers.

SUBCELLUIAR LOCATION: Secreted; extracellular matrix.

ALTERNATIVE PRODUCTS:

Event-Alternative splicing; Named isoforms=1;

Comment.A number of isoforms are produced. Each of the "extra domain" and the connecting strand 3 are present in some forms of fibronectin and absent in others;
                                                                                                                                                                                                                                                                                                                                                             -1 TISSUE SPECIFICITY: Plasma FN (soluble dimeric form) is secreted by hepatocytes. Cellular FN (dimeric or cross-linked multimeric forms), made by fibrolasts, epithelial and other cell types, is deposited as fibrils in the extracellular matrix.
-!- PTM: Sulfaced (By similarity).
-!- SIMILARITY: Contains 12 fibronectin type I domains.
-!- SIMILARITY: Contains 15 fibronectin type II domains.
-!- SIMILARITY: Contains 15 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Acute phase; Alternative splicing; Cell adhesion; Cell shape;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Direct protein sequencing, Glycoprotein, Heparin-binding, Phosphorylation, Plasma, Pyrrolidone carboxylic acid, Repeat, Sulfation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pyrrolidone carboxylic acid. Fibrin- and heparin-binding 1. Collagen-binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pibronectin type I 1.

Eur. J. Haematol. 67:176-184 [2001].

-I- FUNCTION: Fibronectins bind cell surfaces and various compounds including collagen, fibrin, heparin, DNA, and actin. Fibronectins are involved in cell adhesion, cell motility, opsonization, wound healing, and maintenance of cell shape.

-I- SUBDNIT: Mostly heterodimers or multimers of alternatively spliced variants, connected by 2 disulfide bonds near the carboxyl ends; to a lesser extend homodimers. Interacts with FBLNI and LGALS3BP (EV similarity).

-I- SUBCELLULAR LOCATION: Secreted; extracellular matrix.

-I- ALTERNATIVE PRODUCTS:

Event=Alternative splicing; Named isoforms=1;

Comment=A number of isoforms are produced. Each of the "extra domain" and the connecting strand 3 are present in some forms of fibronectin and absent in others;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. ISOUG SPECIFITY: Plasma FN (soluble dimeric form) is secreted by hepatocytes. Cellular FN (dimeric or cross-linked multimeric forms), made by fibroblasts, epithelial and other cell types, is deposited as fibrils in the extracellular matrix.
INDUCTION: Glucocorticoids suppressed mRNA expression and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 synthesis.

Schwarzbauer J.E., Tamkun J.W., Lemischka I.R., Hynes R.O.;
Three different fibronectin mRNAs arise by alternative splicing
within the coding region.";
Cell 35:421-431 (1983).
Induding collagen, fibrin, heparin, DNA, and actin. Fibronectins
are involved in cell adhesion, cell metility, opsonization, wound
healing, and maintenance of cell shape.
I SUBUNIT: Mostly heterodimers or multimers of alternatively spliced
variants, connected by 2 disulfide bonds near the carboxyl ends;
to a lesser extend homodimers. Interacts with FBLN1 and LGALS3BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

binding Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin bidomains of human fibronectin.

Example 3; Fig 6; 58pp; English.

This sequence represents a human fibronectin coding sequence fragment, containing fibrin binding domains. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (FG) activation, and fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a FG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human FG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminoen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circularing blood plasminogen to plasmin, thus adding in the localisation of the plasminogen activation process to the site of pathological thrombus. This systemic plasminogen activation encountered during clinical use streptokinase

pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG: The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of ardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation activation process and activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)

                                                                                                                                            This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBD) protein coding sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, and fibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the abblity to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a
                                                                         40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Proteins with cell migration stimulatory activity used in treating wound and preventing scarring.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a human migration stimulatory factor (MSF) protein. Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptide can be used for modulating cell migration, healing a wound and for preventing scarring. The present sequence represents the nucleotide sequence encoding a human MSF1-alpha protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21 TrpGluLysProTyrGlnGlyTrpMetMetValAspCysThrCysLeuGlyGluGlySer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ArgileGlyAspThrTrpSerLysLysAspAsnArgGlyAsnLeuLeuGlnCysIleCys

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel method of characterising prostate tissue in a subject and to compositions and methods for cancer diagnostics, including cancer markers, in particular prostate cancer. Prostate cancer (PCA) is a leading cause of male cancer-related death. Additional serum and tissue biomarkers would aid diagnosis. The invention may provide means of producing compounds with a cytostatic activity or allow the development of gene therapy. The methods of the invention useful for characterising prostate tissue in a subject, screening compounds, characterising inconclusive prostate biopsy tissue in a subject, detecting AMACR (alpha-methylacyl-coenzyme A racemase) expression in a bodily fluid, characterising tissue in a subject, diagnosing cancer in a subject and inhibiting the growth of cells. The present sequence is a DNA sequence which is preferably utilised in the method of the invention.
                                                                                                                                                                                                                                   Characterizing prostate tissue comprises providing a prostate tissue sample from a subject and detecting the presence or absence of expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CCCATAGCTGAGAAGTGTTTTGATCATGCTGCTGGGACTTCCTATGTGGGTCGGAGAAACG 656

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel protein (and the gene which encodes it) which has, a matrix binding region which assembles to a cell surface, or extracellular matrix surrounding the cell, and a leukaemia inhibitory factor region which suppresses cell differentiation of embryonic stem cells. The invention is useful for suppressing cell differentiation. The invention thus enables efficient and continuous proliferation. The invention thus enables efficient and continuous proliferation of embryonic stem cells can be prepared in large quantities and utilised for fundamental research and applications. The present sequence is that of a gene which encodes the human mini-fibronectin protein which was used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel protein which has matrix binding region which assembles to c
